DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 8-16 and 43-52 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ress et al in view of Moir. Ress et al teach the claimed subject matter, see figures 16-16, except for showing the use of a fusion reactor as a charge particle source. Note programmer 751 for control of the magnetic field strength between the coils. Moir is applied for showing that it is old and well known to use a fusion reactor a source of charged particles and in view of this teaching it would have been obvious to modify the Ress et al system by to obtain the charged particles via fusion reactor, since

the same is only one of many systems conventionally known to deliver charged particles to a reactor. Note means 18 in Moir for teaching obviousness of using charged particles for energy conversion. Note figure 9 in Ress et al, which teaches separate coils for reversing the magnetic field strength between outer coils 300a and 300d. Note that means 751 in Ress is used for collimating the charged particles. Use of a magnetic mirror as per claim 10 is a routine choice, used conventionally in particle transport in combination with magnetic fields.
